

# Analysis of crab abundance, presence/absence, and carapace length

December 1, 2017

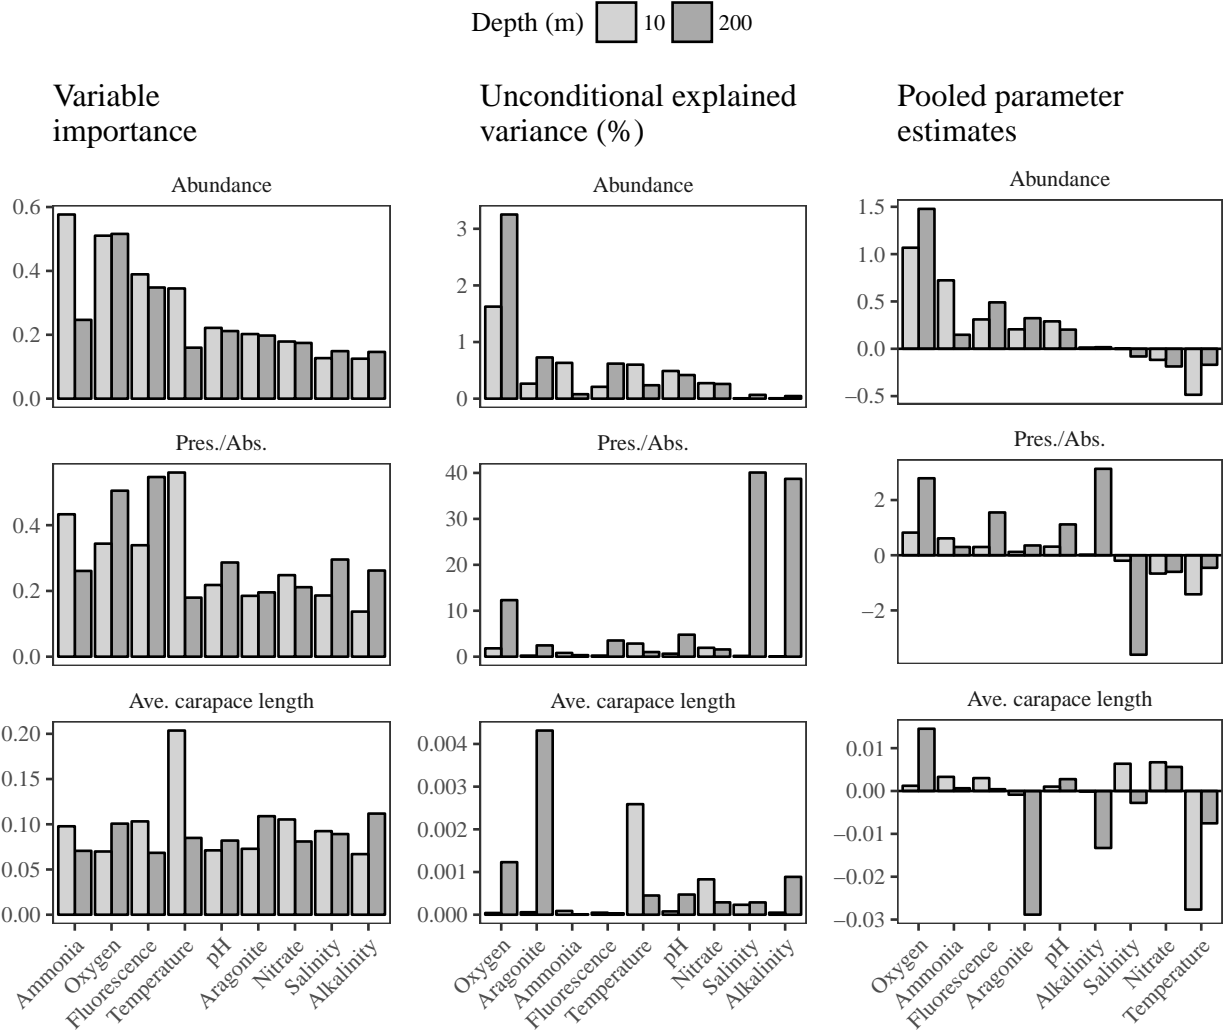

Figure 1: Results of model selection analysis with three crab population variables (abundance, presence/absence, carapace length) by shallow and deep water. Variable importances and pooled estimates show summarized results from multiple models that evaluated all parameter combinations. The unconditional explained variance (%) is the effect of each variable independent of all other variables.

Table 1: Top five selected models for crab abundance at shallow and deep water. Input variables were alkalinity, ammonia, aragonite, fluorescence, nitrate, oxygen, ph, salinity, and temperature. All explanatory variables were scaled and centered.

Models	Int.	Alkalinity	Ammonia	Aragonite	Fluorescence	Nitrate	Oxygen	pH	Salinity	Temperature	df	logLik	AICc	delta
